

1 **A Note about Interpreting this Document**

2 **March 18, 2024: This is a community consultation draft document.**

3 The InCommon Technical Advisory Committee's SAM2Int/Entity Category Deployment
4 Guidance Working Group has produced a series of deployment guidance to help InCommon
5 Federation adopt/deploy support for the REFEDS Anonymous Access, Pseudonymous Access,
6 and Personalised Access Entity Categories (we refer to them together as the * Access Entity
7 Categories).

8 **This is a Three-in-One Document**

9 These guidance materials are organized in three loosely connected volumes: 1. Understanding
10 the Access Entity Categories, 2. Deployment Guidance for InCommon Participants, and 3.
11 Working with Attributes required by these categories. They are joined together in a single
12 document to facilitate community review. In their final published format, the topics will be parsed
13 into a series of web articles cross-linked among each other.

14 **More are Coming**

15 We are aware that the InCommon community will likely need additional detailed guidance, for
16 example, around migration strategies. A new TAC working group is forming to develop these
17 additional materials. We welcome your input and participation.

40 About the REFEDS Access Entity Categories

41 In 2023, REFEDS published the latest revisions of three attribute release entity categories
42 designed to facilitate privacy-preserving, standard, and streamlined user information release in
43 federated transactions. These are Anonymous Access, Pseudonymous Access, and
44 Personalized Access categories. See [Understanding the REFEDS Access Entity Categories](#).

45 The InCommon Federation (InCommon) endorses and strongly encourages the widespread
46 adoption of these categories when requesting and releasing user information in federated
47 transactions. Specifically, InCommon recommends two ways to use these categories:

48 **Adopt the categories as intended** - These entity categories are designed to facilitate
49 streamlined access to resources by allowing an identity provider (IdP) to configure automatic
50 attribute release to any qualifying service provider (SP) in the federation. We recommend all
51 InCommon IdP's to support these categories. We also recommend that whenever possible, all
52 InCommon service providers declare their attribute requirements using one of these 3
53 categories.

54 **Using these categories as default attribute bundles** - Where automatic attribute release isn't
55 feasible, we recommend that IdPs use the attribute bundles defined in these categories as
56 default attribute bundle templates in their IAM integration process. An SP in the federation
57 should always support attributes defined in these bundles when integrating with InCommon
58 identity providers.

59 Volume I: Understanding the REFEDS Access

60 Entity Categories

61 InCommon's Attribute Release Recommendations

User Attribute	Personalized	Pseudonymous	Anonymous
user identifier (subject-id)	✓	⊘	⊘
pseudonymous pairwise user identifier (pairwise-id)	⊘	✓	⊘
person name (displayName, givenName, sn)	✓	⊘	⊘
email address (mail)	✓	⊘	⊘
organization (schacHomeOrganization)	✓	✓	✓
affiliation (eduPersonScopedAffiliation)	✓	✓	✓
assurance (eduPersonAssurance)	✓	✓	⊘

62

63 Legend

64 ✓ Required by category

65 ⊘ Not allowed in category

66

67 What about eduPersonEntitlement?

68 While not a required attribute in these categories, eduPersonEntitlement is also discussed in the
69 context of releasing authorization support information. See [Authorization](#) for additional
70 information.

71 The Personalized Access Category

72 The REFEDS Personalized Entity Category registers Service Providers that have a proven need to
73 receive a small set of personally identifiable information to effectively provide their service to the user
74 or to enable the user to signal their identity to other users within the service. The Service Provider
75 must be able to effectively demonstrate this need to their federation registrar (normally the Service
76 Provider's home federation) and demonstrate their compliance with regulatory requirements
77 concerning personal data through a published Privacy Notice.

78 See: [REFEDS Personalized Access entity category](#)

79 In the InCommon Federation, a Service Provider must [qualify as a REFEDS Research &
80 Scholarship](#) Category Service Provider to qualify as a Personalized Access category Service
81 Provider.

82 The Pseudonymous Access Category

83 The REFEDS Pseudonymous Access entity category enables authenticated, privacy-preserving
84 federated access where a Service Provider requires proof of successful authentication, and
85 offers personalized user experience, but does not require any additional personal information
86 that would identify the individual accessing the resource. The Pseudonymous Access category
87 achieves this via the use of a pseudonymous user identifier (pairwise-id).

88 See: [REFEDS Pseudonymous Access entity category](#)

89 Common uses of this category include anonymous access to licensed content where the service
90 wishes to allow the user to save settings.

91 In the InCommon Federation, any Service Provider (SP) may register as a Pseudonymous
92 Access Category SP.

93 The Anonymous Access Category

94 The REFEDS Anonymous Access entity category enables anonymous access to a restricted
95 resource in a way that adheres to privacy and data protection regulations. It enables a Service
96 Provider to require proof of successful authentication, and receive information about the
97 individual's relationship to the identity provider organization, but not receive any personal
98 information that would identify the individual accessing the resource.

99 See: [REFEDS Anonymous Access entity category](#)

100 Common uses of this category include anonymous access to licensed content (library, online
101 journals, etc).

102 In the InCommon Federation, any Service Provider (SP) may register as an Anonymous Access
103 Category SP.

104 Volume II: Deployment Guidance

105 for Identity Providers

106 When developing an adoption plan, InCommon IdP operators should adopt the following
107 two-part deployment strategy:

108 Part I: Implement the basics - all InCommon IdP should support the 109 required attributes named in the categories

110 Whether your IdP can automatically release attributes based on an SP's entity category, your
111 IAM operation should be ready to support every attribute named in each of the three categories.
112 Doing so establishes a common vocabulary to communicate user information among
113 InCommon registered services. Further, use the guidance provided in [Working with Required](#)
114 [Attributes](#) to make sure your interpretation of these attributes is consistent with the InCommon
115 community's expectations.

116 As you implement support for these attributes, consider using the three categories as basic
117 attribute bundle templates in your IdP configuration. Whether you support the automatic release
118 mechanism required by the REFEDS entity categories or not, you can at least use these
119 templates to standardize attribute release to individual SPs.

120 Part II: Scaling support

121 In parallel, work with your organizational data stewards to support the entity categories, i.e.,
122 enable automatic attribute release using the entity category syntax to qualified service
123 providers.

124 for Service Providers

125 Each InCommon Service Provider operator should implement processes to determine its
126 services' user information needs. Based on that assessment, determine the privacy
127 characteristics that apply to your SP; if applicable, declare your SP as one of the three
128 Anonymous Access, Pseudonymous Access; or Personalized Access. Where applicable, plan
129 appropriate migrations.

130 Within the InCommon Federation, an SP needs to qualify as a Research & Scholarship SP to
131 register as a Personalized Access category SP; conversely, a current R&S SP should register
132 as a Personalized Access SP and plan appropriate migrations from R&S to Personalized.

133

134 | **My SP has varying user information needs...**

135 | If your platform represents multiple resources with different data needs, it's a strong
136 | indicator that you should register multiple SAML SP entities in the federation.

137 When requesting basic user information, an SP should use the attributes mentioned in these
138 categories. Some of the attributes are more complex to work with than might be expected. Make
139 sure to follow the guidance provided in [Working with Required Attributes](#) to ensure your
140 interpretation of these attributes is consistent with the InCommon community's expectations.

141 for Federation Operator

- 142 • Update tooling, documentation, and processes to drive the adoption described above.
- 143 • Engage international R&E federation to iron out EC-based release governance and
144 mechanics
- 145 • [https://wiki.refeds.org/display/ENT/Requirements+for+Federations+Operators+Assessin
146 g+Access-Related+Entity+Categories](https://wiki.refeds.org/display/ENT/Requirements+for+Federations+Operators+Assessin+g+Access-Related+Entity+Categories)

147 Volume III: Working with Required Attributes

148 user identifier (subject-id)

149 The **subject-id** attribute, or SAML General Purpose Subject Identifier, is a single-valued, unique
150 value used to identify an individual user. A subject-id is intended to be both globally unique and
151 correlatable across system domains.

152 A subject-id consists of a left-hand side (a case-insensitive identifier value with a Very
153 Constrained character set) and a right-hand side (a domain, or scope), separated by the '@'
154 character.

155 **There is a technical definition for “Very Constrained”**

156 "VERY CONSTRAINED" is

157 `<uniqueID> = (ALPHA / DIGIT) 0*126 (ALPHA / DIGIT / "=" / "-")`

158

159 where "=" is the padding in the base 32 alphabet,

160 and "-" is to support UUIDs;

161 thus, base 32 encoding of another value could be suitable.

162

163 More on Base32 Encoding: <https://en.wikipedia.org/wiki/Base32>

164

165 See: [SAML V2.0 Subject Identifier Attributes Profile Version 1.0](#)

166 Guidance for Identity Provider

167 Longevity and Uniqueness

168 A subject-id is designed to be a unique identifier representing a person in systems across
169 potentially many organizations. Once issued and shared, it becomes very difficult to change.
170 Therefore, the most crucial property of a subject-id is its stability; avoid populating it with values
171 that are likely to change in the course of normal business processes.

172 Remember: anytime you change a person's subject-id, you are taking on a substantial change
173 coordination effort to update all service providers you integrate with to update their records as
174 well. Failing to do so will likely cause access problems for that person.

175 Reuse existing identifiers when appropriate

176 Start by carefully reviewing the subject-id's definition. Do you have an existing identifier that
177 meets the subject-id's requirements?

178 If so, consider reusing that identifier by configuring your IdP attribute release mechanisms to
179 send that value as a subject-id as well as its original intended attribute. This approach allows
180 you to support subject-id in your IdP quickly.

181 A commonly used identifier in InCommon is eduPersonPrincipalName (ePPN). The following
182 checklist may help you determine whether your ePPN (or any identifier) is a suitable identifier to
183 reuse as subject-id:

- 184 ● Our ePPN is case sensitive, i.e., JOHN@domain and john@domain represent two
185 different people.
- 186 ● We allow the user to petition to change (parts) of their ePPN, e.g., our ePPN is
187 <net-id>@<domain>, and we allow a user to change their <net-id>
- 188 ● We re-assign ePPNs, i.e., we re-assign net-id, so two different people might have the
189 same ePPN over time.
- 190 ● We know our institution is about to change its name, and the domain we currently use
191 will no longer be valid.

192 If you answered “Yes” to any of the questions above, your ePPN is a poor candidate as a
193 subject-id. Do you have another identifier that would allow you to answer “No” to all of those
194 questions?

195 **Start Now**

196 Introducing a new identifier in an IAM ecosystem is challenging. It is much more so to introduce
197 a new identifier across a large community. We need everyone to start now.

198 If you have an existing identifier you can reuse, configure your IdP to release subject-id now.
199 You are well ahead of the curve and are well-positioned to help the community widen support for
200 these new attribute release categories.

201 If you don't have an existing identifier, start devising plans to introduce one in your IAM system.
202 Engage the InCommon community in conversation. Share your ideas and challenges. Make the
203 community work for you.

204 **Lending / Getting Help with subject-id Migration**

205 We understand that introducing and migrating to new identifiers can be a complex and
206 time-consuming challenge. To achieve widespread adoption of these categories, we believe that
207 we must introduce a cohesive and comprehensive identifier migration plan in 2024. We need
208 your input and help to make that happen. Stay tuned for a call for participation in 2024.

209 **Guidance for Service Provider**

210 Compared to other unique identifiers (eduPersonPrincipalName, eduPersonUniqueID, etc.) in
211 use today, subject-id's definition clears up syntax ambiguities, improves uniqueness, and
212 generally facilitates its use by an SP. In particular, it is designed for case-insensitive comparison,

213 has a defined size, has a limited character set, and is expressed in a form that is easy to store
214 and display, but still globally unique.

215 **subject-id is Atomic**

216 When processing a subject-id, an SP must ensure that the entire subject-id string is treated as
217 an atomic unit. While parts of a subject-id value have meaning, a subject-id should never be
218 split into separate parts (left of @ and right of @) when stored. This is similar in concept in the
219 treatment of a social security number (SSN). While parts of an SSN have meaning (area, group,
220 serial number), an SSN is always stored as an atomic value.

221 **Verify the Issuer**

222 The domain (aka scope) part of a subject-id indicates the identifier's issuing organization.
223 Before accepting a subject-id, an SP must verify that the IdP issuing a subject-id is authorized to
224 issue identifiers using that scope by verifying that the identifier's domain appears in a
225 <shibmd:Scope> extension in the IdP's SAML metadata.

226 **Lending / Getting Help with subject-id Migration**

227 We understand that introducing and migrating to new identifiers can be a complex and
228 time-consuming challenge. To achieve widespread adoption of these categories, we believe that
229 we must introduce a cohesive and comprehensive identifier migration plan in 2024. We need
230 your input and help to make that happen. Stay tuned for a call for participation in 2024.

231 **pseudonymous pairwise user identifier (pairwise-id)**

232 The "pairwise-id" attribute is a SAML-defined "identifier" (that is, a single-valued, unique value
233 used to identify an individual user) used to establish a consistent and privacy-preserving
234 relationship between an identity provider (IdP) and a service provider (SP) for a specific user.

235 The pairwise-id value is generated by the IdP and is unique to the combination of the user and
236 the SP. It prevents different SPs from correlating and linking a user's activities across multiple
237 service providers. This helps protect user privacy and prevents the creation of comprehensive
238 user profiles by aggregating data from different SPs.

239 By assigning a distinct and unique identifier to each user and SP combination, the IdP can
240 provide a consistent user experience while minimizing the sharing of personal information
241 between SPs.

242 When a user authenticates with an IdP and requests access to a specific SP, the IdP produces a
243 pairwise-id for that specific user-SP relationship. The SP can use this identifier to recognize and
244 provide personalized services to the user without being able to identify the user across different
245 SPs. Of course, the same identifier must be produced for subsequent exchanges between that
246 IdP and SP for a given user.

247

See: SAMLV2.0 Subject Identifier Attributes Profile Version 1.0

248

<https://docs.oasis-open.org/security/saml-subject-id-attr/v1.0/saml-subject-id-attr-v1.0.od>

249

[t](#)

250 The format of this attribute is very precisely constrained. It is scoped (see also
251 eduPersonScopedAffiliation), consisting of a left-hand side (a case-insensitive identifier value
252 with a very constrained character set) and a right-hand side (a domain), separated by the '@'
253 character.

254 **Guidance for Identity Provider**

255 **Lending / Getting Help with pairwise-id Migration**

256 We understand that introducing and migrating to new identifiers can be a complex and
257 time-consuming challenge. To achieve widespread adoption of these categories, we believe that
258 we must introduce a cohesive and comprehensive identifier migration plan in 2024. We need
259 your input and help to make that happen. Stay tuned for a call for participation in 2024.

260 **Guidance for Service Provider**

261 **Implementation Strategy**

262 In contrast to older approaches to solving this problem, the “pairwise-id” attribute has several
263 important properties to facilitate its use by SPs. In particular, it is designed for case-insensitive
264 comparison, has a defined size, has a limited character set, and is expressed in a form that is
265 easy to store and display, but still globally unique.

266 However, it is crucial for SPs handling this attribute to ensure that the value and scope are
267 manipulated and stored as a unit, never split into separate parts. It is also crucial to ensure that
268 identifiers are only accepted if they are asserted by an IdP authorized by some form of policy to
269 assert a particular scope. Failure to do so may result in impersonation risks.

270 **Lending / Getting Help with pairwise-id Migration**

271 We understand that introducing and migrating to new identifiers can be a complex and
272 time-consuming challenge. To achieve widespread adoption of these categories, we believe that
273 we must introduce a cohesive and comprehensive identifier migration plan in 2024. We need
274 your input and help to make that happen. Stay tuned for a call for participation in 2024.

275 **person name (displayName, givenName, sn)**

276 There are three common LDAP attributes historically mapped into SAML to express a person's
277 name (legal or otherwise).

278 The “givenName” and “sn” attributes are used to express the traditionally Western concepts of
279 “given” and “family” names, respectively. The primary value of separating the fields is to allow
280 applications to control the sorting of name information.

281 One disadvantage is that not all cultures treat names the same way, and people may not always
282 have a first or last name to populate. The “displayName” attribute is traditionally a way to allow a
283 full name to be expressed without artificial constraints placed on the formatting, but it lacks
284 standardization around the ordering of individual portions of the name. Leading with a family
285 name is better for sorting, but looks more awkward when used in other contexts.

286 Lacking any perfect solution to this problem, providing all three of these attributes as a group is
287 the best option we have.

288 **Guidance for Identity Provider**

289 **Implementation Strategy**

290 While there are few absolute constraints on these attributes, one notable difference in LDAP is
291 that “givenName” and “sn” are multi-valued and “displayName” is not. This stems from the
292 historical purpose of LDAP, which was a search. Many SPs are not likely to handle multiple
293 values for these attributes well, and it is best to limit them to a single value when possible.

294 Notably, there is no constraint on whether these attributes should carry legal or so-called
295 “preferred” name values, but experience has shown that very few applications need a legal
296 name, and the most common purpose for these attributes tends to be greeting people or
297 presenting lists of users, and preferred names tend to work better for these use cases. Having
298 said this, it is obviously not ideal for users to have full control over the values of these attributes
299 with no oversight, since that creates opportunities for mischief. Most organizations leverage the
300 data sufficiently that minimal oversight is sufficient to prevent egregious problems.

301 With respect to ordering, it is suggested that “displayName” be used to carry names in
302 “speaking order”. In other words, for Westernized names, the given name is followed by the
303 family name. Other cultures may have different conventions.

304 It is inadvisable to populate these attributes (externally at least) with “fake” values to signal their
305 absence. It may be common in source systems to find whitespace or a single period or other
306 conventions used to satisfy the constraints of badly implemented applications when users do
307 not have a particular name value. Do not expose these conventions in SAML; simply omit any
308 attributes that would not have a value.

309 Of course, the release of these attributes should always be limited to services for which the real
310 identity of the user is important and relevant (or, if the default, by acknowledging clearly that the
311 IdP is not operated as a privacy-preserving service).

312 Guidance for Service Provider

313 Implementation Strategy

314 As noted above, applications should be aware that the ordering of “displayName” is not
315 standardized. They should also be aware that “givenName” and “sn” may contain multiple
316 values or none at all. While this makes building user interfaces difficult, assuming anything
317 contrary to the definitions of these attributes is not a solution to that problem. Forgoing the use
318 of the information outside of very limited contexts (e.g., greeting a user directly) may be the best
319 course.

320 Of course, support for Unicode in these attributes is quite important, more so perhaps than with
321 most of the other attributes one handles. Consult your software’s documentation for details on
322 any special steps needed in this regard.

323 mail

324 The “mail” attribute is a user attribute defined in [RFC4524](#) to carry a user’s email address. From
325 RFC4524: “The mail (rfc822mailbox) attribute type holds Internet mail addresses in Mailbox
326 RFC5321 form (e.g., user@example.com).”

327 Guidance for Identity Provider

328 While this attribute is formally multi-valued and does not specifically connote “officialness”, it is
329 suggested for interoperability to limit this attribute to a single value, generally the user’s official
330 email of record at the home organization. Including multiple values, or including self-asserted,
331 external email addresses, while permissible, is likely to lead to interoperability challenges with a
332 variety of SPs.

333 Guidance for Service Provider

334 When working with InCommon Participants, an email address should only be used as a means of
335 contact. The “mail” attribute is not a suitable user identifier, and in particular, lacks stability at many
336 organizations due to name changes and other vagaries of email system management.

337 Why is an email address not an appropriate user identifier?

338 Email address is a popular way to identify a user and their organizational affiliation in
339 consumer-oriented federated access use cases. It is easy. Everyone has at least one email
340 address from a consumer ISP or social media platform. Companies always issue an email
341 address to their employees. One can often deduce which company a person works for from the
342 domain in her email address.

343 Right?

344 As it turns out, those assumptions don't always hold in the research and educational space.
345 There are several reasons why you should not rely on an email address as a unique user
346 identifier when handling federated access in InCommon:

- 347 1. **Life events and changes in affiliation/role lead to email address change** - A
348 person's interaction in the higher education community often spans a long time. During
349 that period, the person's relationship with the community evolves. For example, a person
350 may be a learner, a teacher, a researcher, an employee, a donor, and/or a parent to a
351 learner. Further, a name change due to life events can also trigger an email address
352 change. Email address is not a reliable persistent identifier when correlating identities
353 across federated systems. Changing email addresses doesn't scale. Many systems
354 consume it and it isn't feasible to identify what systems need to be notified.
355
- 356 2. **Email address may be reassigned** - Institutions frequently reassign an email address
357 when a person leaves the institution. In federated systems that rely on an email address
358 as a user identifier, this can lead to the wrong person accessing resources owned
359 by/assigned to another.
360
- 361 3. **Email address is not always assigned by the institution** - Some institutions allow
362 parts of their user community to supply their preferred email address
363 (bring-your-own-email) instead of requiring the use of an institutionally assigned email
364 address. Services deployed in the higher education community should not assume the
365 @domain portion of a person's email address is a reliable indicator of a person's
366 affiliation with an institution. For example, one of the largest universities on the West
367 Coast allows its students to supply their preferred email address. Over 60% of the
368 students chose that option. Those who do so will not have a @university email on
369 record.
370
- 371 4. **Email is not a guaranteed unique identifier** - Email is a means of contacting its
372 owner/recipient. It is no different than a telephone number. Just as people share
373 telephone numbers, email addresses can be shared. For example, a university's policy
374 may allow family members studying at the same university to use the same email
375 address when communicating with that university. An email address is not guaranteed
376 to be unique to an individual.
377
- 378 5. **Email address may not be validated** - An email address is a form of contact, not a
379 user identifier. Depending on organizational practices around contact information
380 validation, an individual's email address may not be strongly validated. Unless the
381 organization performs some type of proof-of-control confirmation for the email mailbox, a
382 person can enter someone else's email address as a contact. A Service Provider relying
383 on the email attribute as a primary identifier is vulnerable to impersonation attacks. Since
384 a higher education identity provider does not process an email address as a unique
385 identifier, A service provider working with a higher education institution should not
386 depend on the email address as a user identifier.

387 organization (schacHomeOrganization)

388 schacHomeOrganization specifies a person's home organization using the domain name of the
389 organization.

390 **See: Official Definition of schacHomeOrganization**

391 <https://wiki.refeds.org/display/STAN/SCHAC+Releases>

392 Guidance for Identity Provider

393 Which domain do I use?

394 schacHomeOrganization's definition does not provide detailed information on how to interpret "a
395 person's home organization". There are two basic interpretations:

396 **Home Organization is a person's primary "real-life" association** - a person's home
397 organization is the organization they are primarily associated with.

398 **Home Organization is the IdP operator issuing the user's credentials** - a person's home
399 organization is the organization operating the IdP issuing the user's credentials.

400 This distinction may be important when an IdP is a shared service representing multiple
401 organizations, e.g., a university system-wide IdP representing member universities in a system.

402 The decision on what home organization to display will likely be influenced by technical and
403 nontechnical factors within your organization.

404 Domain must be registered in Scope

405 When sending a domain value in schacHomeOrganization, the domain must be registered in the
406 <shibmd:Scope> element of the IdP's SAML metadata.

407 When to use schacHomeOrganization

408 Because schacHomeOrganization can only be a single value, it will have limited use for shared
409 IdP representing multiple organizations, especially if people consider themselves to be
410 members of more than one of the organizations served by the IdP.

411 For all * Access Categories, InCommon IdP operators should release a value that is present in
412 their scope(s) registered with InCommon, and is explainable within the organization.

413 What is the SCHAC schema?

414 [SCHAC, or SCHEMA for ACademia](#), is a common person data schema designed to facilitate
415 higher education inter-institutional data exchange. This schema was originally produced by the
416 European TERENA Task Force on Middleware. It was transferred to [REFEDS Schema Editorial](#)
417 [Board](#) for ongoing maintenance.

418 Guidance for Service Provider

419 Implementation tips and strategies

420 **Verify against Scope** - On receiving a schacHomeOrganization value, an SP must ensure the
421 value is present in the <shibmd:Scope> element of the Issuer's published SAML metadata.
422 Any non-matching value is considered an invalid claim and should be discarded.

423 **Be mindful of schacHomeOrganization's limits** - The schacHomeOrganization attribute is a
424 single value attribute, capable of indicating only one organization to which a person is affiliated.
425 In scenarios where an Identity Provider (IdP) operates as a shared service in a multi-institutional
426 environment, an individual might have associations with multiple organizations in that
427 environment. The specific interpretation of these values is at the discretion of the IdP operator.

428 affiliation (eduPersonScopedAffiliation)

429 eduPersonScopedAffiliation conveys an individual's affiliations within a specific domain within an
430 organization. In federated access, the Identity Provider (IdP) operator transmits one or more
431 values to a Service Provider (SP), communicating broad categories that signify a person's
432 association with the organization. An eduPersonScopedAffiliation value consists of a left and
433 right component, separated by an "@" sign.

434 The left component, representing affiliation, is one of the 8 defined values from the
435 eduPersonAffiliation attribute. The right-hand side component (scope) in
436 eduPersonScopedAffiliation designates the domain associated with the person's affiliation. The
437 scope presented in an eduPersonAffiliation value should match the right-hand side (scope) of
438 the person's eduPersonPrincipalName identifier in the same assertion. Nevertheless, IdP
439 operators have the flexibility to employ additional scopes to denote a person's connection with a
440 sub-unit (e.g., campus, college, academic medical center) within a larger organization.

441 For instance, when a university system's IdP serves multiple campuses within the system, the
442 right-hand side component may indicate the specific campus or campuses with which the
443 person holds defined affiliations. A person studying at campus A while employed at campus B in
444 the same system would simultaneously have affiliations of student@campusA.edu,
445 member@campusA.edu, employee@campusB.edu, and member@campusB.edu.

446 **See: Official Definition of eduPersonScopedAffiliation**

447 <https://wiki.refeds.org/display/STAN/eduPerson+2021-11#eduPerson202111-eduPerson>
448 [ScopedAffiliation](https://wiki.refeds.org/display/STAN/eduPerson+2021-11#eduPerson202111-eduPerson)

449 Basic Implementation tips and strategies

450 **Know your people** - Have the ability to identify who is a faculty, who is a student, etc in your
451 organization; Grouper is a great tool for managing these relationships.

452 **Multiple affiliations** - Within higher education, a person can, and often have multiple affiliations
453 with an institution; a law professor (faculty, employee) may be pursuing an MBA degree
454 (student); an administrator may have split appointments with two schools (e.g.,
455 staff@dentistry.acme.edu, staff@nursing.acme.edu). Make sure your IAM system can support
456 multiple affiliations for a person.

457 **Affiliation != Authorization** - More precisely, there is no need to assume that these affiliations
458 must directly translate to authorization to access any service. As an IdP, focus on conveying
459 how a person is related to your organization. It is the SP's responsibility to build authorization
460 decisions based on these relationships. If you do need to convey explicit authorization to a
461 service or feature, eduPersonEntitlement is the attribute to use.

462 **eduPersonScopedAffiliation is useful beyond these Access categories.** Regardless of your
463 support status for the three REFEDS access entity categories, support
464 eduPersonScopedAffiliation so that when needed, you are ready to send that information to any
465 SP you interoperate within individual SP attribute release policies.

466 **How do I plan the “right-hand side” values?**

467 The right-hand side of any scoped attribute value is a claim of scope/domain. It is an IdP's way
468 of conveying that the value holder has a relationship with the organization represented by that
469 scope/domain.

470 To make such claims, an IdP must have the authority to do so (i.e., an IdP from the University of
471 Texas cannot make claims on behalf of England's Oxford University). To ensure such authority
472 within the InCommon Federation, an IdP must register any scope/domain it uses in attribute
473 assertions in the “Scope” element in its IdP metadata.

474 An IdP operator may determine at its discretion any number of scopes to use to represent a
475 person's relationship with units within its organization. To keep things manageable, we
476 recommend keeping the division at a fairly high level, e.g., school/college within a university, etc.

477 **What are the valid “left-hand side” values and which of them do I need to implement?**

478 eduPersonAffiliation, therefore eduPersonScopedAffiliation, defines 8 types of affiliations:
479 faculty, student, staff, alum, member, affiliate, employee,
480 library-walk-in.

481 **As a Service Provider, how do I interpret eduPersonScopedAffiliation values received from 482 an IdP?**

483 eduPersonScopedAffiliation conveys a person's relationships to an organization. It is not meant
484 to convey authorization to access specific services. While there are finite valid values defined in
485 this attribute, A person's home organization ultimately determines the precise interpretation of
486 those values (e.g., not all institutions define “student” the same way).

487 As an SP, if your access policy is compatible, (e.g., any member of an organization, as
488 determined by that organization, can access your service), eduPersonScopedAffiliation is a
489 simple and scalable way to enable access.

490 **When you need more information to determine access or authorization...**

491 The Access Entity Categories likely do not fit your situation. The more tailored
492 eduPersonEntitlement is likely a good attribute for individualized service needs.

493 *Question for consultation reviewer: how much more do we say here?*

494 **Configuring eduPersonScopedAffiliation for Anonymous and Pseudonymous Access**

495 As Anonymous and Pseudonymous Access categories are designed for privacy-preserving
496 access, always consult your local/regional policies before releasing an individual's specific
497 affiliation values. When policies allow, all applicable values should be released, but in particular,
498 an IdP should always assert `member` or `affiliate` for any applicable individuals.

499 **Configuring eduPersonScopedAffiliation for Personalized Access**

500 When working with the Personalized Access category, an IdP should assert all applicable
501 defined affiliation values of an individual.

502 **About “member” and “affiliate”**

503 **Are you using “member” and “affiliate” correctly?**

504 *from the eduPerson specification:*

505 *“... “Member” is intended to include faculty, staff, student, and other persons with a full set of*
506 *basic privileges that go with membership in the university community (e.g., they are given*
507 *institutional calendar privileges, library privileges, and/or VPN accounts)... ”*

508 *“... The “affiliate” value ... indicates that the holder has some definable affiliation to the*
509 *university NOT captured by any of faculty, staff, student, employee, alum and/or member.*
510 *Typical examples might include event volunteers, parents of students, guests, and external*
511 *auditors...”*

512 The `member` value is meant to represent a person who has a close and active relationship with
513 the organization. Specifically, `faculty`, `staff`, `employee`, and `student` are member of an
514 organization. The IdP's operator's home organization policies determine who is a faculty, student,
515 employee, or student and any ambiguity in those policies will also be present in the `member` value.

516 Note: A holder of the affiliation `alum` is not typically `member` since they are not eligible for the full set
517 of basic institutional privileges enjoyed by faculty, staff, and students.

518 The `affiliate` value for `eduPersonAffiliation` indicates that the holder has some definable
519 affiliation to the university NOT captured by any `faculty`, `staff`, `employee`, `student`,

520 alum, and/or member. Typical examples might include event volunteers, parents of students,
521 guests, and external auditors. An IdP organization determines who is an affiliate within its
522 institutions.

523 **Comparison with eduPersonAffiliation**

524 eduPersonAffiliation should contain the same list of unique values as the “left-hand side” values
525 present in eduPersonScopedAffiliation. As noted above, the left-hand side values are of limited
526 use in the entity categories and are of even less use if the IdP represents multiple
527 sub-organizations.

528 **assurance (eduPersonAssurance)**

529 The eduPersonAssurance attribute provides information about the level of assurance or
530 confidence that can be placed in the identity of an individual. It helps determine the extent to
531 which an individual's identity has been verified, authenticated, or authorized within an
532 educational environment.

533 **See: Official Definition of eduPersonAssurance**

534 <https://wiki.refeds.org/display/STAN/eduPerson+2021-11#eduPerson202111-eduPerson>
535 [Assurance](#)

536 The InCommon Federation uses eduPersonAssurance to convey the level of an IdP's
537 confidence in the subject's real-world identity, as defined by the REFEDS Assurance
538 Framework. There are a variety of assurance frameworks defined, usually by the government or
539 industry bodies; the REFEDS framework was defined by the worldwide higher education
540 community.

541 **Guidance for Identity Provider**

542 **How do I use eduPersonAssurance?**

543 The REFEDS Assurance Framework defines signals allowing an IdP to convey two sets of
544 information:

- 545 ● The IdP meets the conformance criteria outlined in the REFEDS Assurance Framework
- 546 ● The extent to which the identity of the individual accessing a resource (therefore
547 referenced in an authentication assertion) has been vetted

548 **Conveying an IdP's conformance with REFEDS Assurance Framework**

549 The InCommon Baseline Expectations for Trust in Federation requires all IdPs registered in the
550 InCommon Federation to meet requirements comparable to the conformance criteria in the
551 REFEDS Assurance Framework.

552 An InCommon-registered IdP should always send the REFEDS Assurance Framework
553 conformance identifier (<https://refeds.org/assurance>) when eduPersonAssurance is a
554 part of an assertion, regardless of the individual's identity assurance level. This simply allows
555 the SP to make the relevant inferences based on the other values supplied (or based on their
556 absence).

557 **Expressing an individual's identity assurance level**

558 See [REFEDS Assurance Framework Implementation Guidance for InCommon Participants](#)

559 **Guidance for Service Provider**

560 This section is left blank pending InCommon's updated identity assurance guidance based on
561 REFEDS Assurance Framework 2.0

562 **Additional Discussion: Authorization**

563 The Anonymous category and, to a lesser extent, the other two categories, all lack an effective
564 and appropriate means of handling authorization as a use case, as noted in the various
565 category specifications. The most suitable attribute for this purpose, eduPersonEntitlement [Ref]
566 is "outside" the formal attribute bundles because it is generally not automatable, and the
567 bundles are at their core meant to lead to a more automated release of attributes.

568 That said, there are scenarios where authorization can reasonably be automated without
569 compromising privacy, and the commonly encountered "site-licensed access" contracts common
570 to many library subscriptions and some other cloud services are one such example. Such
571 contracts typically apply to "everyone affiliated with the organization", and there is a standard
572 entitlement value defined for this purpose, "urn:mace:dir:entitlement:common-lib-terms" [Ref].

573 IdPs are therefore encouraged to support this entitlement value and to make it available when it
574 applies along with the other required attributes, for all three bundles.

575 SPs with authorization use cases are encouraged to support eduPersonEntitlement for this
576 purpose, and those with a compatible licensing model are encouraged to support the standard
577 value noted above when applicable.
