Debian CManage Packages

The following Debian packages are available through the CManage Debian Repository:

- [co-base](#)
- [co-setup](#)

An analysis and explanation of each package follows.

Package Information

co-base

This is the base package for CManage that ensures all other general dependencies are installed.

co-setup

This package drops in files and configs for the initial bootstrapping of CManage.

- `/etc/init.d/co-setup` - This file kicks off vasetup.
- `/usr/bin/vasetup` - This file creates the initial passwords and starts the co-setup webpage. This will not run if `/etc/comanage/setup.ini` has `state=configured` in the setup section.
- `/usr/bin/vapkgconfigure` - This file does several things:
 - it bootstraps the LDAP directory including adding the first person.
 - it creates passwords for mysql and ldap and stores them in the passwords ini file.
