

Certificate Authenticator Plugin

The Certificate Authenticator plugin manages information about X.509 Certificates for CO People. (*experimental*)

 This plugin is considered Experimental.

Configuration

1. This is a non-core plugin, see [Installing and Enabling Registry Plugins](#) for more information.

Certificate Attributes

CertificateAuthenticator does not currently support the storage of the entire certificate, but rather limited attributes such as Subject DN and Issuer DN. Currently, the expectation is that an Authentication system would use these identifier to validate the certificate, though this could change in a future release..

Supported Provisioners

As of Registry v3.2.0, the [LDAP Provisioning Plugin](#) supports writing certificate information via voPerson.
