Internet2 Identity Services

What is Identity Services?

Identity Services provides a self-service system for community members to request access and management rights to Internet2 resources in order to facilitate a working group or other collaboration. It leverages the InCommon Federation. In the background, the system uses COmanage and Grouper to manage the registry and permissions.

Individual Users

To get started you can go through the **Registration process**. See the **FAQs** for additional information.

Identity Provider Operators

Most IdP operators will need to take some action to ensure they are releasing the proper attributes.
If your Identity Provider releases the Research & Scholarship (R&S) attribute bundle, you are all set. If not, we encourage you to take this opportunity to move to R&S. See more information here for Identity Provider operators and configuring your IdP.
