

Grouper funnel

We have several information systems from which we need to get information about members of these groups:

- teachers, staff, students,...
- courses students and teachers
- lessons students and teachers
- departments students, teachers, ...
- ...

GrouperLoader doesn't fit for us because some systems (for example AFS groups) doesn't have database interface. Also we want fast tool which will return groups and their members in few seconds and doesn't make significant load to source information systems.

So we develop simple application which provides generic database interface and interface for developing custom classes.

You can download [GrouperFunnel.zip](#) which contains:

- sample config file
- binary distribution with required libraries
- Java sources
- shell script

Sample Spring configuration file.

```
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE beans PUBLIC "-//SPRING//DTD BEAN//EN" "http://www.springframework.org/dtd/spring-beans.dtd">
<beans>

```

Every source is fetched in separate thread. Result is stored in simple csv file. We plan to change it to more verbose XML format.

Currently we have config file with twelve sources. With optimized sql and custom classes completes fetching of all data in several seconds. With [our custom provisioning](#) we are able to accomplish near realtime distribution of changes in central systems to Grouper and consequently in Sun IDM.
