Authentication

Authentication involves proving the identity of a client and server to each other before exchanging sensitive information.

Possible topics:

- Authentication for web
    - Issues with HTTP authentication (Basic/Digest, TLS, SPNEGO)
    - Web SSO as a "solution" to issues
    - API vs Server/Container
        - Examples / Investigations in Popular Frameworks
    - Reverse Proxies
    - Other "session" considerations (incl. Logout)

- Authentication for non-web
    - TLS
    - OTP over TLS
    - SASL / GSS-API
        - Moonshot
    - Tie to web authentication

- Server Authentication

- Externalizing authentication; what are the concrete development implications, if any?
    - Is it just not assuming a password collection UI?
    - From single domain to federated:
        - IdP Discovery
        - Identifiers
        - Error Handling
        - Logout
