

GFIPM

GFIPM (Global Federated Identity and Privilege Management)

DATE and TIME: May 27, 2011, 9:00 AM

CONVENER: Jeff Krug, Georgia Tech

SCRIBE: Andrea Beesing

Slides: [GFIPM SLIDES](#)

of ATTENDEES: 8

MAIN ISSUES DISCUSSED

- What is GFIPM? See slides. Work is focused on supporting data model for federated systems, IdM, audit privacy functions
- Three networks involved: RISS, JNET, CISAnet; other groups have joined or are considering joining
- LAISP was another federation, hub and spoke model, now SEGIS (FBI)
- Providing bug fix reports back to Shibboleth community
- Not closely engaged in NSTIC at the moment. Opportunities may exist here
- Much work being done on policy around interfederation
- IdP's have complete audit logs? Yes. NSTIC model is to maintain privacy at the IdP level regarding release of attributes
- Have written tool to detect errors to track down source of access problems and address. Potential interest in open sourcing this capability.
- No plans to go international
- Intent to use LoA3 and 4
- UApprove would not go well with this audience
- Where will this go? Model with state and local LE agencies will continue to grow. At stage where value hasn't reached critical mass yet. May merge with FBI/SEGIS model
- Usability is critical for this user base which will in part determine timeframe for significant roll-outs
- Using Justice Reference Architecture for security model at this point
- Driving force to release of this information is probably presidential directive in 2002 for information sharing across agencies

ACTIVITIES GOING FORWARD / NEXT STEPS

- Look at cloud initiative work on standardizing schemas and offer in put
- May not fit in this category--reports on progress/status are of interest

-
