

# Mondo

At [Stockholm university sakai](#) with extensions for [shibboleth](#) federated access was used to build [mondo](#) - a collaborative system for both traditional learning-oriented as well as project-oriented work. Shortly after the launch of mondo, the Swedish department of education decided to merge Stockholm university with [The Stockholm Institute of Education](#). During the next semester (the merger being scheduled for 1/1 2008) mondo will be used together with federated access to provide a temporary solution for a common learning platform until the course-management systems have been merged. This illustrates how federated access to services can come into play even when all users are essentially under the same administrative control.

Sakais course-management API raises important questions about how to manage complicated information models (such as course information) in a federated setting.
