

New Features Added to Dynamic Web Pages

InCommon has added a number of new features to its [dynamic web pages](#) that provide information about all of the services available throughout the InCommon Federation. We hope this increases the value of federation for:

- Sponsored Partners, by showing more information about the services you provide.
- users of services, by enabling you to find new federated services.

This version of the Federation Info Pages includes some new pages:

- a list of all organizations published in Federation metadata
- for each organization, a list of IdPs and SPs that that organization has deployed

The above pages are in addition to existing Federation Info Pages:

- lists of all identity providers and services providers deployed in the Federation
- individual pages for each that include:
 - the organization's logo
 - names and descriptions of services
 - links for information and privacy statements
 - contact information
 - for service providers, a list of requested attributes.

All of the pages – new and existing – have also been enhanced to include:

- exclusive use of modal dialogues (instead of popping up new windows)
- better error handling and reporting (using modal dialogues)
- a consistent look-and-feel across all pages
- better browser caching (and therefore faster load times)
- more technical information per entity on demand

You can access all of these pages by visiting <https://incommon.org/federation/info/>

If you find missing information for your organization or service, contact your local site administrator to add the appropriate elements to your metadata. In particular, you'll see a number of service providers listed under "other." Your administrator can fix that simply by providing a display name in metadata.

You can also visit our FAQ (<https://spaces.at.internet2.edu/x/5IOVAQ>) for more information.
