

August 2012 Progress Report

Summary Since September 2011

Over the past year, the Registries workgroup conducted an intensive review of the Kuali KIM, Open Registry (jasig/Rutgers), and Central Person Registry (CPR) Registry solutions. The materials collected during that review can be found on the [Registry Evaluation](#) page and the outcome of that effort can be found on the [Registry Evaluation Summary](#) page.

The group also conducted a review of two open source ID match tools (OpenEMPI and the Oyster project from the University of Arkansas) and developed a strawman proposal for an ID match tool that would serve the needs of higher education (also available on the [Registry Evaluation](#) page).

Next Steps

- Penn State to deploy CPR and Rutgers to deploy Open Registry in production
- Penn State to make CPR code base available under open source license (ready to "click and download" to quote RL Bob)
- Open Registry dev team to get OR back into a state where code base is not Rutgers-specific and with a governance structure for community input. Migrate OR out of "incubation" to full project status
- ID Match
 - Make decision to build new ID match engine or build functionality (including admin UI) against existing open source ID Match tool
 - Build dev ID match tool, integrating with common SORs -- UCB and Kuali have resources to commit to this in the near term
 - SOR > Registry Integration
 - Define standard registry interfaces so that over time, Open Registry and CPR can support them, and campuses can readily integrate with one or the other
