

About the COnmanage Project

The COnmanage Project is an effort by the Internet2 Middleware Initiative to develop a set of capabilities that allow collaborative organizations (COs) to meet their objectives using key collaboration tools in a secure and effective framework. By leveraging external (federated) identity management services, authentication and authorization of group members are handled in a single, efficient process that feeds from each member's home organization into the various applications (such as wikis, calendaring, conferencing, and domain applications) that are available to CO participants.

This page looks at some of the administrative detail around the COnmanage project, including license information, bug tracking, grant information, and more.
